An Introduction To Star Formation

"Star formation is one of the most active research fields in modern astronomy and is also the key to understanding problems as diverse as galaxy evolution and the origin of planets. This book, written by two highly regarded experts, first poses the questions that define the field of star formation and then gives a remarkably comprehensive yet concise survey of the underlying physics.

An Introduction to Star Formation

The first step in the process of creating stars is the formation of dense cores within a clump of gas and dust (Figure 7 (a)). It is generally thought that all the material for the star comes from the core, the larger structure surrounding the forming star.

Winds, bubbles and explosions are a feature of star formation and early life. Here the young hot Wolf-Rayet star WR124 is surrounded by glowing gas jetting out into space at around 160 000 km per hour. The filaments and arcs of gas include blobs of glowing gas each some 160 billion km wide with the mass of 30 Earths.

Star - Star - Star formation and evolution: Throughout the Milky Way Galaxy (and even near the Sun itself), astronomers have discovered stars that are well evolved or even approaching extinction, or both, as well as occasional stars that must be very young or still in the process of formation. Evolutionary effects on these stars are not negligible, even for a middle-aged star such as the Sun.

Star formation begins when the denser parts of the cloud core collapse under their own weight/gravity. These cores typically have masses around 10⁴ solar masses in the form of gas and dust. The cores are denser than the outer cloud, so they collapse first. As the cores collapse they fragment into clumps around 0.1 parsecs in size and 10 to 50 ...
