Wet scrubber designs include spray tower, tray-type, and packed-bed scrubbers, which are generally referred to as low-energy scrubbers. Packed bed scrubbers are commonly used for gas absorption. This type of scrubber spreads the liquid over packing material in order to provide a large surface area for liquid/gas interaction.

A spray tower scrubber is a low energy scrubber and is the simplest wet scrubber used for particulate control. It consists of an open vessel with one or more sets of spray nozzles to distribute the scrubbing liquid. Typically, the gas stream enters at the bottom and passes upward through the sprays.

venturi scrubbers to 40-60% (or lower) for simple spray towers [1]. Improvements in wet scrubber designs have increased collection efficiencies in the sub-micron range. Wet scrubber systems have some advantages over electrostatic precipitators (ESPs) and baghouses. Wet scrubbers are smaller and more compact than baghouses or ESPs. They have

The two most common scrubber technology used today are wet or dry systems. Wet FGD systems introduce a spray of alkaline sorbent consisting of lime or limestone (primarily limestone) into the exhaust gas. The alkali reacts with the SO₂ gas to form calcium sulfite (CaSO₃) or calcium sulfate (CaSO₄) that is collected in a liquid slurry form ...
